NOMENCLATURE

| | |
|----------|--|
| a | speed of sound (m/s) |
| A | rotor area (m^2) |
| A_0 | mean coefficient (harmonic analysis) |
| A_n | cosine coefficient (harmonic analysis); n = harmonic number |
| b | number of blades = 3 |
| BL | buttlne (m) |
| B_n | sine coefficient (harmonic analysis); n = harmonic number |
| c | chord (m) |
| COLL | collective pitch, referenced to 75% radial station (deg) |
| C_T | thrust coefficient |
| C_{ZM} | thrust parameter |
| EIf | blade flapwise bending stiffness ($N \cdot m^2$) |
| EI_l | blade edgewise bending stiffness ($N \cdot m^2$) |
| f_{tx} | total rotating in-plane force at hub in x_s -direction (N) |
| f_{ty} | total rotating in-plane force at hub in y_s -direction (N) |
| f_{tz} | total rotating out-of-plane hub force (N) |
| F_S | fuselage station (m) |
| F_X | total nonrotating in-plane force in X_s -direction (N) |
| F_Y | total nonrotating in-plane force in Y_s -direction (N) |
| F_Z | total nonrotating out-of-plane force (N) (F_Z is equivalent to f_{tz}) |
| g | gravitational acceleration (m/s^2) = 9.8 |
| GJ | torsional stiffness ($N \cdot m^2$) |
| IAS | indicated air speed (m/s) |

| | |
|--------------------------|---|
| I_f | blade flap inertia ($\text{kg}\cdot\text{m}^2$) |
| I_l | blade lag inertia ($\text{kg}\cdot\text{m}^2$) |
| I_p, I_{pp} | blade polar moments of inertia ($\text{kg}\cdot\text{m}^2$) = $\iint (Y^2 + Z^2) \, dm$, $\iint (Z^2 - Y^2) \, dm$, respectively |
| I'_p, I'_{pp} | sectional polar moments of inertia ($\text{kg}\cdot\text{m}^2/\text{m}$) = $\iint (Y'^2 + Z'^2) \, dm$, $\iint (Z'^2 - Y'^2) \, dm$, respectively |
| I_{xx}, I_{yy}, I_{zz} | aircraft principal moments of inertia ($\text{kg}\cdot\text{m}^2$) = $\iint X^2 \, dm$, $\iint Y^2 \, dm$, $\iint Z^2 \, dm$, respectively |
| I_{xy}, I_{xz}, I_{yz} | aircraft products of inertia ($\text{kg}\cdot\text{m}^2$) = $\iint XY \, dm$, $\iint XZ \, dm$, $\iint YZ \, dm$, respectively |
| l | lag damper displacement (mm) |
| l_A | vertical distance from shaft strain gage at A to rotor hub center (m) = 0.394 |
| l_B | vertical distance from shaft strain gage at B to rotor hub center (m) = 0.149 |
| l_o | distance between lag hinge and lag damper line of action (m) |
| LAT | lateral blade cyclic pitch, positive roll to the right (deg) |
| LON | longitudinal blade cyclic pitch, positive nose up (deg) |
| m | helicopter mass (kg) |
| m_{RED} | reduced helicopter mass (kg) |
| m_{tAx} | total rotating in-plane moment at shaft section A in x_s -direction (N-m) |
| m_{tAy} | total rotating in-plane moment at shaft section A in y_s -direction (N-m) |
| m_{tBx} | total rotating in-plane moment at shaft section B in x_s -direction (N-m) |
| m_{tBy} | total rotating in-plane moment at shaft section B in y_s -direction (N-m) |
| m_{tx} | total rotating in-plane hub moment in x_s -direction (N-m) |
| m_{ty} | total rotating in-plane hub moment in y_s -direction (N-m) |
| m_{tz} | total rotating out-of-plane hub moment (N-m) |
| M | blade sectional mass (kg/m) |
| MR | main rotor |
| M_X | total nonrotating in-plane hub moment in X_s -direction (N-m) |

| | |
|---------------|---|
| M_Y | total nonrotating in-plane hub moment in Y_S -direction (N-m) |
| M_Z | total nonrotating out-of-plane hub moment (N-m) (M_Z is equivalent to m_{tZ}) |
| n | harmonic number |
| N | load factor |
| p_0 | standard atmospheric pressure (mbar) = 1013.25 |
| p_s | static flight pressure (mbar) |
| r | blade radial location (m) |
| R | rotor radius (m) |
| STAT | static |
| TAS | true air speed (m/s) |
| T_0 | standard atmospheric temperature ($^{\circ}\text{K}$) = 288.16 |
| T_s | static flight temperature ($^{\circ}\text{C}$) |
| TR | tail rotor |
| V | velocity (m/s) |
| WL | water line (m) |
| x,y,z | aircraft c.g. axis system (origin at aircraft c.g., fig. 1a) |
| x_b,y_b,z_b | blade reference axis system (origin at one-quarter chord, fig. 5) |
| x_s,y_s,z_s | rotating-shaft reference axis system (origin at hub center, fig. 14) |
| x_v,y_v,z_v | wind axis system (origin at aircraft c.g., fig. 1c) |
| X,Y,Z | rotor axis system (origin at hub center, fig. 1b) |
| X_b,Y_b,Z_b | blade principal inertia axes (origin at chordwise c.g., fig. 5) |
| X_s,Y_s,Z_s | nonrotating-shaft reference axis system (origin at hub center, fig. 15) |
| Y_G | chordwise blade c.g. location in x_b,y_b,z_b axis system (m) |
| Y_N | Y_b -axis location in x_b,y_b,z_b axis system (neutral axis) (m) |
| Z_N | Z_b -axis location in x_b,y_b,z_b axis system (m) |

| | |
|------------|--|
| α | angle of attack (deg) |
| γ | specific heat ratio for air = 1.4 |
| δ | lag angle (deg) |
| θ | pitch angle (deg) |
| μ | advance ratio |
| ρ | air density (kg/m^3) |
| ρ_0 | standard atmospheric density (kg/m^3) = 1.225 |
| σ | solidity |
| σ_o | density ratio |
| ϕ | angle between Y_b, Z_b axes and y_b, z_b axes (deg) |
| ψ | azimuth angle, measured from tail boom toward advancing side of rotor disk (deg) |
| Ω | rotor rotational speed (rad/s) |

SUMMARY

Data from 23 flight conditions, including level flights ranging from $\mu = 0.14$ to 0.37 and steady turning flights from $\mu = 0.26$ to 0.35 , are presented for an Aerospatiale SA349/2 Gazelle helicopter. The data include hub loads data (for 6 of the 23 conditions), blade structural data at eleven different blade radial stations, and fuselage structural data. All dynamic data are presented as harmonic analysis coefficients (ten harmonics per rotor revolution). This report also documents the data acquisition and reduction procedures. Blade structural and inertial properties are provided in addition to control system geometry and properties.

INTRODUCTION

Measuring and analyzing helicopter oscillatory hub loads is an important step toward the ultimate goal of minimizing vibration. One important purpose of the 1987 flight test of the SA349/2 helicopter was to measure rotor hub loads. This was accomplished by instrumenting the rotor shaft at two locations and determining the resulting rotating and nonrotating loads at the hub. Additional flight measurements acquired at two different blade chordwise c.g. locations, included blade moments at eleven radial stations, pitch link loads, blade flap and lag angles, shaft angle, seat accelerations, servo loads, gearbox strut loads, and lag damper force. Data for 23 flight conditions covering a wide range of thrust levels and speeds are documented in this report.

This flight test of the Aerospatiale SA349/2 helicopter initiated the second phase of joint work between the National Aeronautics and Space Administration and the French Ministry of Defense. The objective of this program is to gain a better understanding of rotor aerodynamic and dynamic phenomena by correlating flight test data from the SA349/2 with French and U.S. rotor analyses. The first phase of cooperative work also consisted of an extensive flight-test program, which was conducted in 1984 in France. The 1984 flight test produced blade airloads and structural loads data (ref. 1). The data documented in this report complement the data given in reference 1 since many of the 1984 flight conditions were duplicated during the 1987 flight program (also conducted in France).

AIRCRAFT AND ROTOR DESCRIPTION

Properties and characteristics of the aircraft and rotor are given in reference 1, but some are repeated here for convenience.

SA349/2 Aircraft

The SA349/2 aircraft consists of a three-bladed, fully-articulated main rotor and a Fenestron tail rotor. Basic aircraft information is given in table 1. Reference axes and sign conventions for aircraft loads are shown in figures 1 and 2, respectively.

Research Rotor

The rotor consists of the Non Articule en Trainee (NAT) hub and three, constant-chord Grande Vitesse (GV) blades. The GV blades are rectangular tipped and have OA209 airfoil profiles. Rotor characteristics and control system geometry are provided in table 2 and figure 3. Figure 4 shows the GV blade planform and twist distribution. Reference axes for the blade sectional properties are shown in figure 5. The sectional characteristics of the blade are tabulated in tables 3 and 4 for chordwise c.g. locations of 24.7% and 26.7%, respectively. The blade chordwise c.g. location is varied by removing or inserting weights in a tube that is part of the blade structure. The tube extends along the length of the blade and is located at the 25% chordwise station. The rotating frequencies of the GV blade for the two different chordwise c.g. locations are shown in figure 6a. The calculations were made using CAMRAD (ref. 2). Similar calculations were made using an Aerospatiale analysis, IAK40 (described in ref. 1), as shown in figure 6b. The CAMRAD results were computed in vacuo, while the IAK40 results include the effects of aerodynamics. Figures 7 and 8 show the IAK40 calculated blade damping ratio and modal frequencies for both c.g. locations. Note that figure 7 shows a calculated instability at the operating rpm for the 26.7% c.g. location, which did not occur during the flight test. This calculated instability may be the result of neglecting unsteady aerodynamics in the IAK40 analysis.

INSTRUMENTATION

The aircraft instrumentation and data acquisition processes are described in this section.

Flight Condition Parameters

The environmental conditions of the flight test were fully documented. Flight condition parameters recorded for each flight test included: helicopter mass; altitude; indicated airspeed; ground pressure and temperature; static flight pressure and temperature; collective-pitch stick position; lateral and longitudinal cyclic pitch stick position; tail rotor pedal position; aircraft pitch and roll angles; aircraft pitch, roll, and yaw rates; load factor; rotor rotational speed; and engine power. All stick positions were translated into the equivalent pitch angles. The collective pitch was referenced to the 75% radial station value.

Rotating Frame Instrumentation

The GV blades were instrumented with 31 strain gages to measure structural loads at eleven radial stations (fig. 9). Flapwise, edgewise, and torsion moments were measured at 9, 10, and 6 radial stations, respectively. Two of the blades were instrumented to measure blade flap angle and lag damper displacement. Figure 10 shows locations of the rotating NAT hub instrumentation. The flap angle was measured using an angular sensor located about the flap hinge. The sensor is composed of two components: one component is fixed relative to the blade flap motion and the other component rotates as the blade flaps about the hinge. The sensor delivers an induced sinusoidal tension. The linear part of this sinusoidal signal is proportional to the rotation angle of the sensor rotating component. The blade lag displacement was measured using a potentiometer. Properties of the lag damper are given in reference 1. All three pitch links were instrumented.

The rotor shaft instrumentation produced four measurements: shaft bending moments at two locations, shaft torque, and shaft vertical force. Figure 11 shows the gage locations. F1SHAFT and F3SHAFT each represent a gage couple (two gages located diametrically opposite each other). The direction of the bending moment is perpendicular to the diameter formed by the gage couple.

Fixed Frame Instrumentation

Fixed frame instrumentation included strain gages on two of the three primary control system servos and strain gages on each of the four main gearbox struts. In addition, pilot- and copilot-seat vertical vibration were measured using accelerometers. Locations of all nonrotating instrumentation are shown in figure 12.

On-Board Data Acquisition

A schematic of the data acquisition process is shown in figure 13. The flight condition parameters were digitized by an onboard modular acquisition unit (UAM). The resulting digitized data stream was recorded on magnetic tape. The flight parameter values presented in this report represent data averaged over one second (approximately seven consecutive rotor revolutions). The rotating frame signals were transferred to the nonrotating frame using 45 channels of a 50-channel slipring. The rotating and nonrotating frame signals were then relayed to seven frequency domain multiplexers. All multiplexing was performed according to the Inter Range Instrumentation Group standard.

DATA REDUCTION

The calculation of additional flight condition parameters and the reduction of strain gage data are presented. Also, the procedure for determining hub loads from shaft loads measurements is described.

Calculated Rotor Flight Parameters

In addition to the parameters discussed in the Flight Condition Parameters section, the following values were calculated:

$$A = \pi R^2 \quad (1)$$

$$\sigma = bc/\pi R \quad (2)$$

$$\sigma_0 = (p_s/p_0) * (T_0/(273.16 + T_s)) \quad (3)$$

$$TAS = IAS/\sigma_0 \quad (4)$$

$$\rho = \rho_0 \sigma_0 \quad (5)$$

$$a = (287 * \gamma * (273.16 + T_s))^{1/2} \quad (6)$$

$$\mu = TAS/\Omega R \quad (7)$$

$$C_T/\sigma = Nmg/(\rho A(\Omega R)^2\sigma) \quad (8)$$

$$C_{ZM} = 6*(C_T/\sigma) \quad (9)$$

$$m_{RED} = m/\sigma_0 \quad (10)$$

Strain Gage and Potentiometer Signals

Strain gage signals were recorded over many rotor revolutions; however, only seven consecutive revolutions were reduced. These seven revolutions correspond temporally to the seven revolutions used to acquire the flight condition parameters. A harmonic analysis of the gage signals was performed for each of the seven revolutions. The results were then averaged. The strain gage signals were converted to harmonic analysis coefficients, ten per rotor revolution, which were then converted into physical units. Although the strain gage data were acquired from all three blades, all data were referenced to the blade 1 azimuth position, starting at 0° azimuth (rear blade position). The lag angle was calculated from the lag displacement (potentiometer signal) using the following relationship.

$$\delta = 0.45l \quad (11)$$

Time histories of the strain gage and potentiometer signals can be reconstructed using the following formula.

$$X = A_0 + \sum_n^{10} [A_n \cos(n\Psi) + B_n \sin(n\Psi)] \quad (12)$$

where $\Psi = 0^\circ$ corresponds to the rear blade position.

Determination of Hub Loads from Shaft Loads

The hub loads were calculated from measured shaft bending moments. Bending moments in the x-direction, m_{tAx} and m_{tBx} , were measured at distances l_A and l_B from the rotor center (fig. 14). The rotating hub forces and moments are represented in figure 14 by (f_{tx}, f_{ty}) and (m_{tx}, m_{ty}) , respectively. The shaft is assumed to be a beam isolated from other external forces and moments. The relationships between the loads at the hub and the loads at sections A and B are:

$$m_{tAx} = m_{tx} - l_A f_{ty} \quad (13)$$

$$m_{tAy} = m_{ty} + l_A f_{tx} \quad (14)$$

$$m_{tBx} = m_{tx} - l_B f_{ty} \quad (15)$$

$$m_{tBy} = m_{ty} + l_B f_{tx} \quad (16)$$

Solving for m_{tx} , m_{ty} , f_{tx} , and f_{ty} gives

$$m_{tx} = (l_A m_{tBx} - l_B m_{tAx})/(l_A - l_B) \quad (17)$$

$$m_{ty} = (l_A m_{tBy} - l_B m_{tAy}) / (l_A - l_B) \quad (18)$$

$$f_{tx} = (m_{tAy} - m_{tBy}) / (l_A - l_B) \quad (19)$$

$$f_{ty} = (m_{tBx} - m_{tAx}) / (l_A - l_B) \quad (20)$$

The moments m_{tAx} and m_{tBx} are measured by the gage couples F1SHAFT and F3SHAFT, respectively. Through symmetry, $|m_{tAx}| = |m_{tAy}|$ and $|m_{tBx}| = |m_{tBy}|$. Also, the phases of m_{tAy} and m_{tBy} lag m_{tAx} and m_{tBx} by 90° . Therefore, all terms required to solve for the total rotating forces and moments at the hub are known. For a rotor with b equally spaced blades, only the $nb \pm 1$ harmonics exist for the rotating frame in-plane hub loads ($f_{tx}, f_{ty}, m_{tx}, m_{ty}$), and only the nb harmonics exist for the out-of-plane loads (f_{tz}, m_{tz}). A coordinate transformation is performed to obtain the fixed frame hub loads, F_X, F_Y, M_X , and M_Y (fig. 15). These loads can be expressed in terms of the rotating frame loads by

$$F_X = f_{tx} \cos(\Psi) + f_{ty} \sin(\Psi) \quad (21)$$

$$F_Y = -f_{tx} \sin(\Psi) + f_{ty} \cos(\Psi) \quad (22)$$

$$M_X = m_{tx} \cos(\Psi) + m_{ty} \sin(\Psi) \quad (23)$$

$$M_Y = -m_{tx} \sin(\Psi) + m_{ty} \cos(\Psi) \quad (24)$$

$$F_Z = f_{tz} \quad (25)$$

$$M_Z = m_{tz} \quad (26)$$

Through phase cancellation, only the nb harmonics exist for the fixed frame loads.

FLIGHT CONDITIONS

The flight envelope included advance ratios from 0.0078 to 0.371 and values of C_T/σ from 0.062 to 0.133 (fig. 16). A complete list of the 23 flight conditions is presented in Appendix A. This flight test attempted to duplicate selected flight conditions from the first test documented in reference 1. This was done by directing the pilot to an altitude such that a desired reduced-mass value was obtained. Once at the desired altitude, the aircraft forward speed was adjusted to obtain a desired true air speed (TAS).

DATA PRESENTATION

As shown in Appendix A, flight V31 consisted of 6 conditions, flight V32 consisted of 7 conditions, and flight V33 consisted of 10 conditions for a total of 23 flight conditions. A list of measured parameters and their sign conventions are provided in Appendix B. Flight V31 and V32 were performed with the blade chordwise c.g. located at 24.7%. The chordwise c.g. for flight V33 was located at 26.7%. Note that Appendix B also indicates which measurements were inoperable for the three flights.

Appendix C contains the following for each of the 23 flight conditions: a) flight test parameters, b) blade bending moments, and c) airframe loads.

Appendix D provides rotating and nonrotating hub loads derived from the measured shaft forces and moments. Only values for flight V31 are provided, since F3SHAFT and the shaft torque gage, CZSHAFT, were inoperable during flights V32 and V33.

The data were checked for consistency where possible. Redundant blade strain gage instrumentation provided blade-to-blade comparisons at 12%, 29%, and 87% radial stations. Also, pitch link loads, blade flap angle, and blade lag angle were redundantly measured. Discrepancies in mean values were noticed for the bending moments, pitch link loads, and lag angle for some of the flight conditions. However, the data are presented here without alteration.

Flight Test Parameters

A list of the environmental conditions and aircraft and rotor trim values precede the tabulated data for each of the flight conditions in Appendix C (for example, see Appendix C, page C1). The average, minimum, and maximum values over seven consecutive rotor revolutions are presented for each parameter. Also, the standard deviation (STD.DEV.) is provided.

Rotor and Aircraft Measurements

The blade structural moments, flap and lag angles, lag damper force, pitch link loads, servo loads, shaft loads, gearbox strut loads, and seat accelerations are all presented in harmonic coefficient form. The coefficients represent the average value over seven consecutive rotor revolutions (10 harmonics per revolution). Note that redundant instrumentation is available for several of the rotor measurements (for example, blade flap angle).

Hub Loads Data

Appendix D presents hub force and hub moment data. Hub load data were measured for flight V31 only. The mean value of the vertical force, F_Z , was not accurate because of signal drift. F_Z is identical to the parameter FZSHAFT in Appendix C. For convenience, the 3/rev and 6/rev values of FZSHAFT are repeated in Appendix D as F_Z .

Appendix D provides the 1/rev, 2/rev, 4/rev, 5/rev, and 7/rev harmonic coefficient values for f_{tx} (total, rotating in-plane force). Recall from the section Determination of Hub Loads from Shaft Loads that $|f_{tx}| = |f_{ty}|$; therefore, only values for f_{tx} are given. In addition, the hub forces in the fixed frame are given in terms of the mean, 3/rev and 6/rev for F_X and F_Y (in-plane forces) and in terms of 3/rev and 6/rev for F_Z . As discussed earlier, $f_{tz} = F_Z$.

Similar information is provided for the hub moments in Appendix D. M_Z is identical to the shaft torque parameter, CZSHAFT, presented in Appendix C. Again, the mean, 3/rev, and 6/rev values of CZSHAFT are repeated in Appendix D as M_Z for convenience.

| V3310 | STEADY TURN | 53 | 2.115 | 0.13300 | 0.2479 |
| V3312 | STEADY TURN | 71 | 1.475 | 0.09355 | 0.3354 |
| V3313 | STEADY TURN | 75 | 1.587 | 0.10320 | 0.3543 |
| V3314 | STEADY TURN | 70 | 1.855 | 0.11300 | 0.3310 |
| V3315 | HOVER O.G.E. | 3 | 1.016 | 0.06225 | 0.0119 |

APPENDIX B

MEASURED PARAMETERS AND SIGN CONVENTIONS

Appendix B lists all measured flight test parameters for the 23 flight conditions. Given for each parameter is the parameter name as used in Appendix C, the physical description, the units, and the sign convention.

| Parameter Name | Description | Units | Sign Convention |
|----------------|---|-------|--|
| FLAP BEND | flap bending moment 12% R; blades 1,3 20% R; blade 2 29% R; blades 1,3 37% R; blade 2 54% R; blade 2 63% R; blade 1 ^a 71% R; blade 2 80% R; blade 1 ^b 85% R; blade 2 | N-m | positive moment created by downward force on blade at tip |
| EDGE BEND | edgewise bending moment 12% R; blades 1,3 20% R; blade 2 29% R; blade 1 37% R; blade 2 46% R; blade 1 54% R; blade 2 63% R; blade 1 71% R; blade 2 80% R; blade 1 85% R; blade 2 | N-m | positive moment created by force at blade tip directed from trailing to leading edge |
| TORSION | torsion moment 12% R; blades 1,3 20% R; blade 2 29% R; blades 1,3 54% R; blade 2 80% R; blade 2 87% R; blades 1,3 | N-m | positive moment created by blade nose-up deflection at tip |
| FLAP | flap angle blade 1 blade 2 | deg | positive angle created by blade flapping upwards |
| LAG | lag angle blade 1 blade 2 | deg | positive, deflection in the direction against rotation |

| | | | |
|----------------------|---|-----|--|
| FLAGDAMP | lag damper force | N | positive, lag damper in tension |
| PTCH LNK LD | pitch link load blade 1 blade 2 blade 3 | N | positive, pitch link in tension |
| SERVO | servos left right | N | positive, upwards force |
| GEAR BOX STRUT | gear box strut load rear left rear right front left front right | N | positive, strut compressed positive, strut compressed positive, strut in tension positive, strut in tension |
| VERT ACCEL | seat acceleration front right seat front left seat | g | |
| F1SHAFT | longitudinal shaft bending moment | N-m | positive, bending toward front of aircraft |
| F2SHAFT | lateral shaft bending moment | N-m | positive, bending toward left side of aircraft (facing forward) |
| F3SHAFT ^c | longitudinal shaft bending moment | N-m | positive, bending toward front of aircraft |
| FZSHAFT | shaft vertical force | N | positive, upwards force |
| CZSHAFT ^d | shaft torque | N-m | positive, counterclockwise as viewed from above |

a not functioning for conditions V3101, V3103

b not functioning for V3109, V32 (all conditions), and V33 (all conditions)

c not functioning for V32 (all conditions) and V33 (all conditions)

d not functioning for V32 (all conditions) and V33 (all conditions)

APPENDIX C
SA349/2 HELICOPTER FLIGHT TEST DATA

Flight test data for each of the 23 flight conditions are listed. A list of flight parameters precedes the data for each condition.

FLIGHT NUMBER V3101

| FLIGHT PARAMETERS | Nº | MINIMUM | MAXIMUM | MEAN | STD. DEV |

APPENDIX D
FLIGHT TEST DATA – HUB LOADS

The measured hub forces and moments for six flight conditions, V3101, V3103, V3105, V3106, V3109, and V3111 are presented for both the rotating and nonrotating frame.

PRECEDING PAGE BLANK NOT FILMED

| 16. Abstract Data from 23 flight conditions, including level flights ranging from $\mu = 0.14$ to 0.37 and steady turning flights from $\mu = 0.26$ to 0.35, are presented for an Aerospatiale SA349/2 Gazelle helicopter. The data include hub loads data (for 6 of the 23 conditions), blade structural data at eleven different blade radial stations, and fuselage structural data. All dynamic data are presented as harmonic analysis coefficients (ten harmonics per rotor revolution). This report also documents the data acquisition and reduction procedures. Blade structural and inertial properties are provided in addition to control system geometry and properties. | | | |
